WEEKLY HEALTH REPORT

NATURE OF THE DATA

The data presented here are taken from the Statistical Reports, Forms 86ab, rendered weekly to the Office of The Surgeon General by every hospital and separate dispensary in the continental United States.

Because of the desirability of placing the information in circulation at the earliest possible time following its receipt, figures are in general shown herein as reported. Where there is some doubt as to the accuracy of the reported figures, their verification is requested, and the fact that they have been so questioned is indicated by the symbol (!).

MORBIDITY DATA

In this report admission rates are shown for all causes (disease and injury) combined, for all diseases combined, for injuries and for a few specific diseases. These rates are presented on an annual basis to facilitate comparisons with corresponding rates in annual and monthly reports. Such annual rates of admission indicate the number of admissions per thousand mean strength which would occur over a year's time if the current week's experience continued for a year.

The report also shows the number of cases of the more common communicable and certain other diseases of special interest. Appended is a list of cases reported for the rarer communicable and certain other diseases.

The number of patients remaining in hospital at the end of the week per thousand strength as given in this report furnishes an approximation to the current non-effective rate. The mean number of non-effectives per thousand strength is given in the summary table for the total United States and for each of the Service Commands.

STATIONS WITH HIGHEST MORBIDITY RATES

Included in the report is a table listing the stations (having a strength of 5000 or over) with the highest morbidity rates from all causes, from all diseases combined, from injuries and from a few specific diseases. Not infrequently, the excessively high rates of admission for all causes and for all diseases combined reported from reception centers reflect a large number of venereal disease cases among newly inducted men. Therefore, more significant of high morbidity from disease are the rates of admission for disease excluding venereal infections existing prior to induction, which rates are also shown in the table.

HOSPITALIZATION DATA

Current hospitalization conditions are presented in terms of bed capacity (normal and total), beds occupied and beds "available vacant." The number of beds "available vacant" is defined as 80% of the total bed capacity less the corresponding beds occupied. The number of beds "available vacant" for each Service Command is the total of the beds "available vacant" for only those stations in which 80% of the total bed capacity exceeds the beds occupied. Beds in dispensaries, convalescent facilities, venereal disease facilities, and college or university training units are not included in this report.

In the case of general hospitals there are shown, in addition, the number of Army patients admitted and disposed of during the week (by death, return to duty, transfer, or otherwise), the number of such patients remaining in hospital (including convalescent facilities, if any) at the end of the week, and corresponding data for battle casualties. Where the hospital has convalescent facilities, the letters (CF) appear after its name. The patients "otherwise" disposed of represent for the most part discharges on account of disability. In the case of Army battle casualties, all of which are currently admitted to general hospitals in this country as transfers, there is shown for each hospital the net number transferred during the week; i.e., admissions by transfer less dispositions by transfer. The total for the country as a whole represents the number of battle casualties evacuated to the United States from overseas theaters.

EXPLANATORY MATTER

In reading the detail tables, it should be borne in mind that admission rates based on small numbers of cases are not reliable. For this reason the symbol (?) is placed after admission rates computed on the basis of 5 or fewer cases.

Where part or all of the current week's data for a particular station has not been received, the latest available figures are substituted therefor and the symbol (#) is placed after the name of the station.

WEEKLY HEALTH REPORT

FOR THE WEEK ENDING 18 FEBRUARY 1944

COMMENT ON CURRENT TRENDS

CURRENT MORBIDITY IN THE CONTINENTAL UNITED STATES

All Causes: Disease and Injury:

As indicated in the chart on page 3, the admission rates from all causes and from all diseases combined both increased for the first time since the second week of January. This increase in morbidity (of about 5 percent) was only partly due to higher admission rates from colds, influenza, etc. For the week ending 18 February 1944 the admission rate from all causes was reported at 781 per thousand per year and the corresponding all diseases rate at 711 per thousand. These rates were about 23 percent below the corresponding rates for the week ending 19 February 1943. The admission rate from injury increased slightly during the week ending 18 February 1944 to 70 per thousand which rate nevertheless remains close to the low level prevailing in recent weeks.

Respiratory Causes

The admission rate from colds, influenza, etc. for the week ending 18 February 1944 was 278 per thousand per year (or about 6 percent higher than for the preceding week) which is almost 30 percent under that recorded for the corresponding week of February 1943. The admission rate from all forms of pneumonia decreased to 18 per thousand or about the level prevailing in November 1943 and more than 20 percent below the rate for the corresponding week of February 1943. About two-thirds of the decrease in the morbidity from pneumonia was accounted for by a reduction in the number of cases of atypical pneumonia.

Common Communicable Diseases:

The number of new cases of measles showed a drop for the first time since the week ending 24 December 1943. The number of new cases of mumps and scarlet fever remained at substantially the same figures as for the preceding week. The number of new cases of meningitis showed a small increase. There was a sharp decrease in the number of new cases of rheumatic fever from the very high figure reported for the week ending 11 February 1944 to about the level prevailing in previous weeks.

VARIATION IN MORBIDITY BY SERVICE COMMANDS:

All causes: Disease and Injury:

The Third and Ninth Service Commands were the only ones to report lower morbidity from all causes for the week ending 18 February 1944. Lower morbidity from disease was reported only by the Third and Fifth Service Commands. The largest increase in morbidity from all causes occurred in the First, Second, and Sixth Service Commands. Sharp increases in morbidity from injury were registered in the Fifth and First Service Commands. The highest admission rate from all causes (of about 990 per thousand) was re-

WEEKLY HEALTH REPORT

FOR THE WEEK ENDING 18 FEBRUARY 1944

COMMENT ON CURRENT TRENDS (CONT'D)

ported from the Second, Sixth, and Seventh Service Commands. The Ninth Service Command was the only one to report morbidity from all causes below 700 per thousand.

Respiratory Causes:

The Military District of Washington was the only Command to report lower morbidity from colds, influenza, etc. even though it experienced a marked rise in pneumonia admissions. The largest increases in morbidity from colds, influenza, etc. occurred in the First, Second and Sixth Service Commands. In the First and Sixth Service Commands these increases were responsible for about half of the sizeable increases in the admission rate from disease reported from these Commands, but in the Second Service Command higher morbidity from respiratory causes accounted for all of the increase in morbidity from disease. The Seventh Service Command continued to report the highest admission rates from colds, influenza, etc. (about 460 per thousand) and high pneumonia (37 per thousand). The lowest morbidity from colds, influenza, etc. and from pneumonia was reported from the Eighth Service Command.

Common Communicable Diseases:

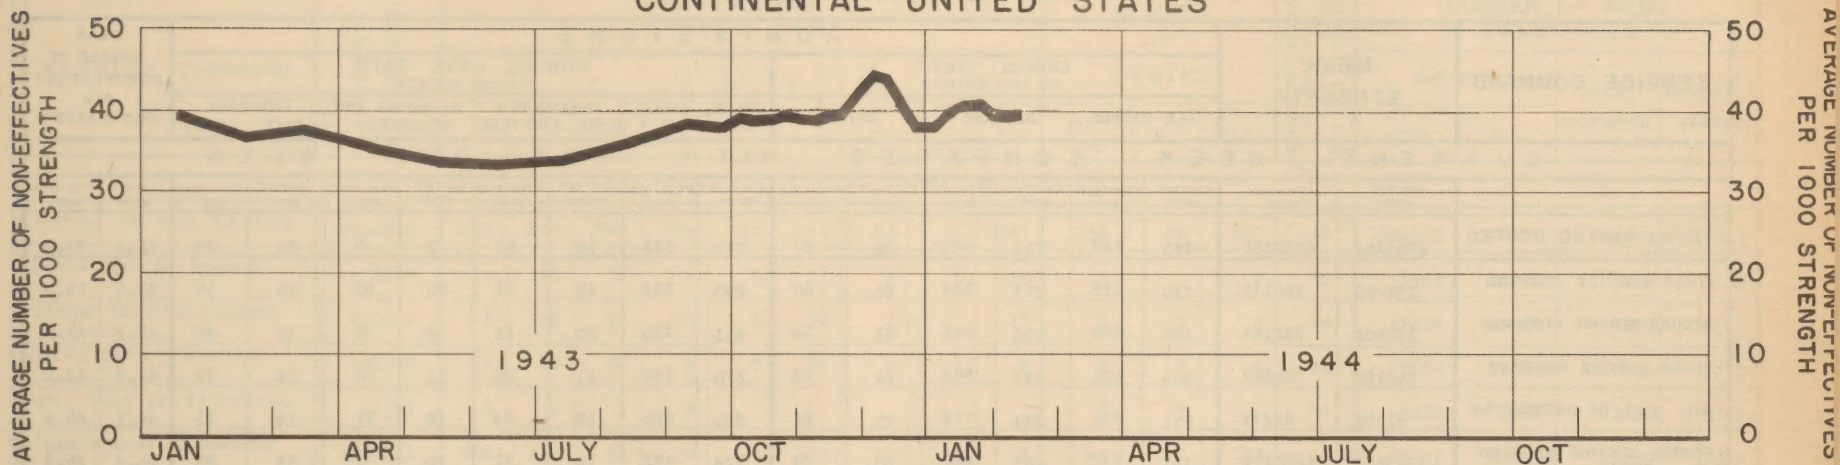

The decline in the number of new measles cases in the Fourth Service Command accounted for practically the entire decline in the total number of new measles cases in the country. The Fourth Service Command nevertheless continued to show by far the largest number of new cases of measles, with most of the others occurring in the Eighth and Seventh Service Commands. The largest number of new cases of mumps continued to be reported from the Fourth, Ninth, and Eighth Service Commands, which together accounted for over 60 percent of the total cases of mumps. The Seventh, Eighth, and Ninth Service Commands reported over 60 percent of the total number of cases of scarlet fever. The increase in the number of new cases of meningitis was fairly uniformly spread. The decrease in the number of new cases of rheumatic fever took place chiefly in the Seventh and Ninth Service Commands.

CURRENT HOSPITAL CONDITIONS:

The total bed capacity as of 18 February 1944 was reported at 378,000 or 5,000 more than at the end of the previous week; this was not an actual increase, but was the result of improved reporting of expansion beds by the Fourth Service Command in compliance with WD Circular No. 43. The number of beds occupied as of 18 February was about 174,000 or 3,000 more than at end of previous week. Despite an increase in beds occupied, the number of "available vacant" beds increased to 130,000 due to the aforementioned correction in reporting procedure. On 18 February there were 21 stations with bed capacity of about 14,000 having no "available vacant" beds; included was only one General Hospital with bed capacity of 1,370. On 18 February 1944 there were 2,177 cases of malaria remaining under treatment, all but 20 of which had presumably been acquired outside United States. The number of neuropsychiatric cases remaining at end of week was reported at 16,354 while the number of tuberculosis cases remaining totaled 1,087.
